Elevator Statement

OnGo is an application built to give *everyone* the possibility to access their personal files and data in *real time* and from *any location and device*. The OnGo application is a simple Web App that allows you to *remotely control* your computer and to *directly access* all the files stored. Unlike Google Drive, OneDrive or iCloud, OnGo *doesn't keep any file stored* in the cloud and doesn't need any upload action by the user to make it available. Our product works as a *link* between your home computer or work laptop maybe and the device that you want to use to connect to it, recovering all the needed files *on user request* and automatically downloading them on the new device. All your data available on any device, this time for real.
